ActivGym

Description

Ageing and not enough physical activity cause the muscles to become less firm and causes sagging. Type 1 muscle fibers provide extra support to keep the muscle firm and prevent sagging by the presence of adiponectin (hormone) in the body.

The ACTIVGYM marine ingredient causes fat tissue (adipose tissue) to release the hormone called adiponectin, this is the same process as when doing physical activity.

The adiponectin hormone gives a signal in to the skeletal muscle to increase the working rate of type 1 muscles fibers, thus giving a “fake” signal to the muscle that it is exercising. This leads to the reduction in fat cells, firming and toning of muscle fibers.

Using ACTIVGYM in combination with physical exercise will give better results in firmness, toning muscle and loss in cm's.

This effective is temporary, same as doing physical exercise, the moment you stop using activgym or stop physical activity muscle will slowly become less firm and cause sagging.

Ingredients:

Glycerin, Aqua, 0.07% Plankton Extract, Glycol, Dimethicone & actigym™ marine ingredient by Lipotec

Applications

ACTIVGYM marine ingredient can be incorporated into daily cosmetic formulations for body care to provide a more toned and redefined silhouette.
